

Tubular golf tee

Abstract

The top of the golf tee is cylindrically tubular. the golf tee has a diameter sufficient for a golf ball to rest on. The outside diameter and the inside diameter then taper down to the bottom with a constant wall thickness until the taper of the outside diameter abruptly becomes more acute and creates a sharp tubular edge when it meets the inside diameter at the bottom. The golf tees can stack one inside the other due to the outside and inside diameters having the same taper.
